The LUA-PHYSICAL library

$Version\ 0.1$

Thomas Jenni

May 2, 2019

Abstract

lua-physical is a pure Lua library which provides functions and object for doing computation with physical quantities. It has been written to simplify the creation problem sets. The package provides units of the SI and the imperial system. Furthermore an almost complete set of international currencies are supported, however without online exchange rates. In order to display the numbers with measurement uncertainties, the package is able to perform gaussian error propagation.

1 Introduction

The author of this package is a teacher at the high school Kantonsschule Zug in Switzerland. The main use of this package is to write physics problem sets. LualATEXdoes make it possible to integrate physical calculations directly. The package has been in use since 2016. Many bugs have been found and fixed. Nevertheless it still is possible, that some were not found yet. Therefore the author recommends not to use this package industry or science. If one does so, it's the responsability of the user to check results for plausability. If the user finds some bugs, they can be reported at github.com or directly to the author (thomas.jenni (at) ksz.ch).

2 Loading

This package is a pure Lua library. Therefore one has to require it explicitly by calling require("physical"). For printing results, the siunitx package can be used. It's recommended to define a macro like \q to convert the lua quantity object to a siunitx expression.

The following Latex preambel loads the lua-physical package and creates a macro \q for printing physical quantities.

Listing 1: basic preamble

```
\usepackage{lua-physical}
      \usepackage{siunitx}
      % configure siunitx
      \sisetup{
        output-decimal-marker = {.},
        per-mode = symbol,
        separate-uncertainty = true,
       add-decimal-zero = true,
        exponent-product = \cdot,
       round-mode = off
      % load the lua-physical package
      \begin{luacode*}
16
        physical = require("physical")
       N = physical.Number
      \end{luacode*}
      % print a physical quantity
      \mbox{\ensuremath{\mbox{newcommand}}\{\q\}[1]{\%}}
        \directlua{tex.print(physical.Quantity.tosiunitx(#1, "scientific-
               notation=fixed,exponent-to-prefix=false"))}%
      }
```

2.1 Dependencies

This is a standalone package. If a pretty print to LuaL^AT_EX is needed, the package siunitx should be installed.

3 Usage

Given the basic preamble, units can be used in lua code directly. By convention, all units have an underscore in front of them, i.e. meter is _m, second is _s. All available units are listed in chapter 4. The Result of the calculation can be printed to Lual*TFX by using the macro \q{}.

Listing 2: The velocity of a car.

```
1 \begin{luacode}
2    s = 10 * _m
3    t = 2 * _s
4    v = s/t
5 \end{luacode}
6
7 A car travels $\q{s}$ in $\q{t}$. calculate its velocity.
8    $$
9    v=\frac{s}{t} = \frac{\q{s}}{\q{t}} = \q{v}
10 $$$
```

A car travels 10 m in 2 s. Calculate its velocity.

$$v = \frac{s}{t} = \frac{10 \,\mathrm{m}}{2 \,\mathrm{s}} = 5.0 \,\mathrm{m/s}$$

In the above listing 2, the variable s stands for displacement and has the unit meter $_m$. The variable t stands for time and is given in seconds $_s$. If mathematical operations are done on them, new physical quantities are created. In the problem above, the velocity v is calculated by dividing s by t. The instance v has the derived unit m/s. By using the macro \q all quantities can be printed to the LualATeX code directly.

3.1 Unit conversion

Very often, the result of a calculation has to be converted to another unit. In the following listing 3 the task is to calculate the volume of a cuboid with lengths given in three different units. If the volume is calculated by multipling all three lengths, the unit of the result is cm mm m. If the unit cm³ is preferred, it has to be converted explicitly. The conversion function is called to() and is available on all physical quantitiy instances. At first this looks a bit cumbersome. The reason of this behaviour is, that the software is not able to guess the unit of the result. In many cases, like in the example here, it's not clear what unit the result sould have. Therefore the user has always to give the target unit explicitly.

Listing 3: The volume of a cuboid.

```
\begin{luacode}
2
      a = 12 * _cm
      b = 150 * _mm
      c = 1.5 * _m
      V = a*b*c
    \end{luacode}
   Find the volume of a rectangular cuboid with lengths $\q{a}$,
    q{b}\ and \ q{c}\ .
11
12
      V= a \cdot b \cdot c
      = \q{a} \cdot \q{b} \cdot \q{c}
      = \q{V}
14
       \uuline{\q{V:to(_dm^3)}}
16
```

Find the volume of a rectangular cuboid with lengths 12 cm, 150 mm and 1.5 m.

```
V = a \cdot b \cdot c = 12 \text{ cm} \cdot 150 \text{ mm} \cdot 1.5 \text{ m} = 2700.0 \text{ cm mm m} = \underline{27.0 \text{ dm}^3}
```

3.1.1 Temperature Conversion

Most of the units transform linearly to base units. Exceptions are the unit degree Celsius <code>_degC</code> and degree Fahrenheit <code>_degF</code>. These units are ambigous and can be interpreted as temperature differences or as an absolute temperatures. In the latter case, the conversion to base units is not a linear, but an affine transformation. This is because degree Celsius and degree Fahrenheit scales have their zero points at different temperatures compared to the unit Kelvin.

By default $_{\tt degC}$ and $_{\tt degF}$ units are standing for temperature differences. If one wants to have it converted absolutely, it has to be done adding / subtracting the quantities $_{\tt degC_0}$ and $_{\tt degF_0}$.

In the following problem, listing 4, the task is to convert temperatures given in the unit degree Celsius and degree Fahrenheit to Kelvin.

Listing 4: Temperature conversion.

```
1 \begin{luacode}
2 theta_1 = 110 * _degC
3 T_1 = ( theta_1 + _degC_0 ):to(_K)
4 theta_1 = T_1:to(_degC) - _degC_0
5
6 theta_2 = 212 * _degF
7 T_2 = ( theta_2 + _degF_0 ):to(_K)
8 theta_2 = T_2:to(_degF) - _degF_0
9 \end{luacode}
10
11 \begin{align*}
10
11 \begin{align*}
12 \vartheta_1 &= \q{theta_1} \\
13 T_1 &= \q{T_1} \\
14 %
```

3.1.2 Uncertainty

The package supports uncertainty propagation. To create a number with an uncertainty, an instance of physical.Number has to be created, see listing 5. It has to be remembered, that N is a alias for physical.Number. The first argument of the constructor N(mean, uncertainty) is the mean value and the second one the uncertainty of the measurement. If the proposed preamble 1 is used, the uncertainty is by default seperated from the mean value by a plus-minus sign. For the uncertainty propagation the gaussian formula

$$\Delta f = \sqrt{\left(\frac{\partial f}{x_1} \cdot \Delta x_1\right)^2 + \dots + \left(\frac{\partial f}{x_n} \cdot \Delta x_2\right)^2}$$

is used. This formula is a good estimation for the uncertainty Δf , if the quantities x_1, \ldots, x_n the function f depends on, have no correlation. Further, the function f has to change linear, if quantities x_i are changed in the range of their uncertainties.

Listing 5: Uncertainty in area calculation.

```
1 \begin{luacode}
2     a = N(2,0.1) * _m
3     b = N(3,0.1) * _m
4
5     A = (a*b):to(_m^2)
6     \end{luacode}
7
8     Calculate the area of a rectangle with lengths $\q{a}$ and $\q{b}$$.
9     $$
10     A = a \cdot b
11     = \q{a} \cdot \q{b}
12     = \underset{uuline}\q{A}}
13     $$$
```

Calculate the area of a rectangle with lengths $(2.00\pm0.10)\,\mathrm{m}$ and $(3.00\pm0.10)\,\mathrm{m}$.

$$A = a \cdot b = (2.00 \pm 0.10) \,\mathrm{m} \cdot (3.00 \pm 0.10) \,\mathrm{m} = \underline{(6.0 \pm 0.4) \,\mathrm{m}^2}$$

Instead of printing always the uncertainties, one can use the uncertainty calculation to provide significant digits.

In the following problem, listing 6, the task is to calculate the volume of an ideal gas. Given are pressure p in _bar, amount of substance n in _mol and temperature T in degree celsius _degC. In order to do the calculation, one has to convert T, which is given as an absolute temperature in degree celsius to the base unit Kelvin first. By setting N.omitUncertainty = true, all uncertainties are not printed.

Listing 6: Volume of an ideal gas.

```
1  \begin{luacode}
2    N.omitUncertainty = true
3    p = N(1.013,0.0001) * _bar
4    n = N(1,0.01) * _mol
5    T = N(30,0.1) * _degC
6
7    V = ( n * _R * (T + _degC_0):to(_K) / p ):to(_L)
8  \end{luacode}
9
10    An ideal gas ($\q{n}$) has a pressure of $\q{p}$ and a temperature
        of $\q{T}$. Calculate the volume of the gas.
11    $$
12    V = \frac{ \q{n} \cdot \q{_R} \cdot \q{(T + _degC_0):to(_K)} }{ \q{p} }
13    = \q{V}
14    = \unuline{\q{V}}
15    $$$
```

An ideal gas (1.0 mol) has a pressure of 1.013 bar and a temperature of 30 $^{\circ}$ C. Calculate the volume of the gas.

$$V = \frac{1.0\, \mathrm{mol} \cdot 8.31\, \mathrm{J/(mol\,K)} \cdot 303\, \mathrm{K}}{1.013\, \mathrm{bar}} = \underline{25\, \mathrm{L}}$$

4 Supported Units

All supported units are listed in this chapter. Subchapter 4.1 lists the seven base units of the International System of Units (SI). In subchapter 4.2 mathematical and physical constants are defined. The subchapter 4.3 contains all coherent derived units from the SI system and 4.4 those which are accepted to use with the SI.

The subchapter 4.5 lists nominal astronomical units, which are proposed by [3]. Subchapter 4.6 lists units, which are common but outside of the SI system. The subchapters 4.7 and 4.8 are dedicated to imperial and U.S. customary units. The last subchapter ?? containts international currencies.

4.1 Base Units

Quantity	Unit	Symbol	Dim.	Definition
number	_	_1	1	The dimensionless number one.
time	second	_s	Τ	The SI unit of time. It is defined by taking the fixed numerical value of the caesium frequency $\Delta\nu_{Cs}$, the unperturbed ground-state hyperfine transition frequency of the caesium 133 atom, to be 9192631770 when expressed in the unit 1/s.
length	meter	_m	L	The SI unit of length. It is defined by taking the fixed numercial value of the speed of light in vacuum c to be 299 792 458 when expressed in the unit of $1.0\mathrm{m/s}$.
mass	kilogram	_kg	M	The SI unit of mass. It is defined by taking the fixed numerical value of the Planck constant h to be $6.62607015\cdot10^{-34}$ when expressed in m ² kg/s.
electric current	ampere	_A	I	The SI unit of electric current. It is defined by taking the fixed numerical value of the elementary charge e to be $1.602176634\cdot10^{-19}$ when expressed in As.

Quantity	Unit	Symbol	Dim.	Definition
thermody- namic temperature	namic		Θ	The SI unit of the thermodynamic temperature. It is defined by taking the fixed numerical value of the Boltzmann constant k_B to be $1.380649\cdot10^{-23}$ when expressed in $1.0\mathrm{kgm^2/(s^2K)}$
amount of substance	mole	_mol	N	The SI unit of amount of substance. One mole contains exactly $6.02214076\cdot10^{23}$ elementary entities. This number is the fixed numerical value of the Avogadro constant N_A when expressed in 1/mol.
luminous intensity	candela	_cd	J	The SI unit of luminous intensity in a given direction. It is defined by taking the fixed numerical value of the luminous efficacy of monochromatic radiation of frequency $5.4 \cdot 10^{14} \mathrm{Hz}$, K_{cd} , to be 683 when expressed in the unit $\mathrm{cd} \mathrm{sr} \mathrm{s}^3/(\mathrm{kg} \mathrm{m}^2)$.
information	bit	_bit	В	The smallest amount of information.
currency	euro	_EUR	\mathbf{C}	The value of the currency Euro.

4.2 Constants

All physical constants are taken from the NIST webpage [1].

Name	Symbol	Definition
pi	_Pi	3.1415926535897932384626433832795028841971 * _1

Absorbed Dose	gray	_Gy	_J/_kg
Dose Equivalent	sievert	_Sv	_J/_kg
Catalytic Activity	katal	_kat	_mol/_s

 $^{^{1}\}mathrm{In}$ the SI system, the quantity Plane Angle has the dimension of a number.

 $^{^2\}mathrm{In}$ the SI system, the quantity Solid Angle has the dimension of a number.

³The unit _PS stands for peta siemens and is in conflict with the german version of the unit horsepower (Pferdestärke). Since the latter is more common than peta siemens, _PS is defined as the german version of horsepower.

 $^{^4{\}rm The}$ unit ${\tt _degC}$ is by default interpreted as a temperature difference.

4.4 Non-SI units accepted for use with the SI

There are a few units with dimension 1.

Quantity	Unit	Symbol	Definition
Time	minute	_min	60 * _s
	hour	_h	60 * _min
	day	_d	24 * _h
Plane Angle	degree	_deg	(_Pi/180) * _rad
	arcminute	_arcmin	_deg/60

5 Lua Documentation

In this chapter, the following shortcuts will be used.

```
1 local D = physical.Dimension
2 local U = physical.Unit
3 local N = physical.Number
4 local Q = physical.Quantity
```

The term number refers to a lua integer or a lua float number. By string a lua string is meant and by bool a lua boolean.

5.1 physical.Quantity

The quantity class is the main part of the library. Each physical Quantity and all units are represented by an instance of this class.

Q.new(q=nil)

Copy Constuctor

```
q: Q or number, optional
Optional argument is either Q, a number or nil.
return: Q
The created Q instance
```

As an argument it takes Q, number or nil. If Q is given, a copy of it is made and returned. If a number is given, the function creates a dimeensionless quantity with that value. In the case nil is given, the quantity _1 is returned.

Example

```
1 myOne = Q()
2 myNumber = Q(42)
3 myLength = Q(73*_m)
```

Q.defineBase(symbol,name,dimension)

This function is used to declare base quantities from which all other quantities are derived from.

```
symbol : string
    The symbol of the base quantity.
name : string
    The name of the base quantity.
dimension : D
    An instance of the D class, which represents the dimension of the quantity.
```

```
return : Q
```

The created ${\tt Q}$ instance.

The function creates a global variable of the created base quantity. The name consist of an underscore concatenated with the <code>symbol</code> argument, i.e. the symbol m becomes the global variable _m.

The name is used for example in the siunitx conversion function, e.g meter will be converted to \meter.

Each quantity has a dimension associated with it. The argument dimension allows any dimension to be associated to base quantities.

Example

```
1 Q.defineBase("m", "meter", L) 2 Q.defineBase("kg", "kilogram", M)
```

Quantity.define(symbol, name, q)

Creates a new derived quantity from an expression of other quantities. Affine quantities like the absolute temperature in celsius are not supported.

The function creates a global variable of the created base quantity. The name consist of an underscore concatenated with the symbol argument, i.e. the symbol N becomes the global variable _N.

The name is used for example in the siunitx conversion function, e.g newton will be converted to \newton.

Example

```
1 Q.define("L", "liter", _dm^3)
2 Q.define("Pa", "pascal", _N/_m^2)
3 Q.define("C", "coulomb", _A*_s)
4
5 Q.define("degC", "celsius", _K)
```

Quantity.defineAlias(symbol, q)

Creates an alias of a quantity.

```
symbol : string
```

The name of the alias.

q: Quantity

The aliased quantity.

1 Q.defineAlias("degC_0", 273.15*_degC)

Quantity.definePrefix(symbol,name,factor)

Defines a new prefix.

```
symbol : string
```

Symbol of the base quantity

name: string

Name of the base quantity

factor: number

The factor which corresponds to the prefix

```
1 Q.definePrefix("c", "centi", 1e-2)
2 Q.definePrefix("a", "atto", 1e-18)
```

Quantity.addPrefix(prefixes, units)

Create several units with prefixes from a given unit.

```
prefixes: string
```

A list of unit symbols.

units: Quantity

A list of quantities.

```
1 Q.addPrefix({"n","u","m","k","M","G"},{_m,_s,_A})
```

Quantity.to(self,q)

Converts the quantity self to the unit of the quantity q.

```
self: Quantity
```

A quantity.

q: Quantity The quantity to wich self will be converted to.

```
1  s = 1.9 * _km
2  print( s:to(_m) )
3  1900.0 * _m
4
5  T = 10 * _degC
6  print( T:to(_K) )
7  10.0 * _K
8  print( T:to(_K) )
9  10.0 * _K
```

Quantity.tosiunitx(self,param,mode)

Converts the quantity into a siunity string.

```
self : Quantity
param : string
mode : Number, 0:\SI, 1:\num, 2:\si

1    s = 1.9 * _km
2
3    print( s:tosiunitx() )
4  \SI{1.9}{\kilo\meter}
5
6    print( s:tosiunitx(nil,1) )
7    \num{1.9}
8
9    print( s:tosiunitx(nil,2) )
10  \si{\kilo\meter}
```

Quantity.isclose(self,q,r)

Checks if this quantity is close to another one. The argument ${\tt r}$ is the maximal relative deviation.

```
self: Quantity
q: Quantity, Number
r: Number

1    s_1 = 1.9 * _m
2    s_2 = 2.0 * _m
3    print( s_1:isclose(s_2,0.1) )
4    true
5    print( s_1:isclose(s_2,0.01) )
6    false
```

Quantity.min(q1, q2, ...)

Returns the smallest quantity of several given ones. The function returns q1 if the Quantities are equal.

```
q1: Quantity, Number, first argument
```

q2: Quantity, Number, second argument

```
1 s_1 = 15 * _m
2 s_2 = 5 * _m
3 print(s_1:min(s_2))
4 5 * _m
```

Quantity.max(q1, q2, ...)

Returns the biggest quantity of several given ones. The function returns q1 if the Quantities are equal.

```
q1: Quantity, Number, first argument
```

q2: Quantity, Number, second argument

```
1 s_1 = 15 * _m
2 s_2 = 5 * _m
3 print(s_1:max(s_2))
4 15 * _m
```

Quantity.abs(q)

Returns the absolute value of the given quantity q.

q: Quantity, Number, argument

```
1 U = -5 * _V
2 print(U)
3 -5 * _V
4 print(U:abs())
5 5 * _V
```

Quantity.sqrt(q)

Returns the square root of the given quantity.

q: Quantity, Number argument

```
1 A = 25 * _m^2
2 s = sqrt(A)
3 print(s)
```

Quantity.log(q, base)

Returns the logarithm of the given quantitiy. If no base is given, the natural logarithm is calculated.

q: Quantity, Number dimensionless argument

base: Quantity, Number dimensionless argument

```
1 I = 1 * _W/_m^2

2 I_0 = 1e-12 * _W/_m^2

3 print(10 * (I/I_0):log(10) * _dB)

4 120.0 * _dB
```

Quantity.exp(q)

Returns the value of the exponential function of the given quantitiy.

q: Quantity, Number dimensionless argument

```
1 x = 2 * _1
2 print( x:exp() )
3 7.3890560989307
```

Quantity.sin(q)

Returns the value of the sinus function of the given quantitiy.

q: Quantity, Number dimensionless argument

```
1 alpha = 30 * _deg
2 print( alpha:sin() )
3 0.5
```

Quantity.cos(q)

Returns the value of the cosinus function of the given quantity. The quantity has to be dimensionless.

q: Quantity, Number dimensionless argument

```
1 alpha = 60 * _deg
2 print( alpha:cos() )
3 0.5
```

Quantity.tan(q)

Returns the value of the tangent function of the given quantity. The quantity has to be dimensionless.

q: Quantity, Number dimensionless argument

```
1 alpha = 45 * _deg
2 print( alpha:tan() )
3 1.0
```

Quantity.asin(q)

Returns the value of the arcus sinus function of the given quantity. The quantity has to be dimensionless.

q: Quantity, Number dimensionless argument

```
1 x = 0.5 * _1
2 print( x:asin():to(_deg) )
3 30.0 * _deg
```

Quantity.acos(q)

Returns the value of the arcus cosinus function of the given quantity. The quantity has to be dimensionless.

q: Quantity, Number dimensionless argument

```
1 x = 0.5 * _1
2 print( x:acos():to(_deg) )
3 60.0 * _deg
```

Quantity.atan(q)

Returns the value of the arcus tangent function of the given quantity. The quantity has to be dimensionless.

q: Quantity, Number dimensionless argument

```
1 x = 1 * _1
2 print( x:atan():to(_deg) )
3 45.0 * _deg
```

Quantity.sinh(q)

Returns the value of the hyperbolic sine function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$\sinh(x) = 0.5 \cdot e^x - 0.5/e^x \quad .$$

q: Quantity, Number dimensionless argument

```
1 x = 1 * _1
2 print(x:sinh())
3 1.1752011936438
```

Quantity.cosh(q)

Returns the value of the hyperbolic cosine function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$\cosh(x) = 0.5 \cdot e^x + 0.5/e^x \quad .$$

q: Quantity, Number dimensionless argument

```
1 x = 1 * _1
2 print( x:cosh() )
3 1.5430806348152
```

Quantity.tanh(q)

Returns the value of the hyperbolic tangent function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$\tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}} \quad .$$

q: Quantity, Number dimensionless argument

```
1 x = 1 * _1
2 print( x:tanh() )
3 0.76159415595576
```

Quantity.asinh(q)

Returns the value of the inverse hyperbolic sine function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$asinh(x) = \ln\left(x + \sqrt{x^2 + 1}\right) \quad .$$

q: Quantity, Number dimensionless argument

```
1 x = 1 * _1
2 print( x:asinh() )
3 0.88137358701954
```

Quantity.acosh(q)

Returns the value of the inverse hyperbolic cosine function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$a\cosh(x) = \ln\left(x + \sqrt{x^2 - 1}\right) \quad , x > 1 \quad .$$

q: Quantity, Number dimensionless argument bigger than or equal to one.

```
1 x = 2 * _1
2 print( x:acosh() )
3 1.3169578969248
```

Quantity.atanh(q)

Returns the value of the inverse hyperbolic cosine function of the given quantity. The quantity has to be dimensionless. Since lua doesn't implement the hyperbolic functions the following formula is used

$$\operatorname{atanh}(x) = \ln\left(\frac{1+x}{1-x}\right) \quad , -1 < x < 1 \quad .$$

 ${\tt q}: {\tt Quantity}, {\tt Number} \ {\rm dimensionless} \ {\rm argument} \ {\rm with} \ {\rm magnitude} \ {\rm smaller} \ {\rm than} \ {\rm one}.$

```
1 x = 0.5 * _1
2 print( x:atanh() )
3 0.54930614433405
```

5.2 physical. Dimension

All physical quantities do have a physical dimension. For example the quantity Area has the dimension L^2 (length to the power of two). In the SI-System there are seven base dimensions, from which all other dimensions are derived. Each dimension is represented by an n-tuple, where n is the number of base dimensions. Each physical quantity has an associated dimension object. It is used to check equality and if addition or substraction is allowed.

Dimension.new(q=nil)

Constructor of the Dimension class.

q: Dimension or string, optional

The name or symbol of the dimension. If **q** is a dimension, a copy of it is made. If no argument ist given, a dimension *zero* is created.

return: Dimension

The created Quantity object

Example

```
1 V_1 = D("Velocity")
2 L = D("L")
3 V_2 = D(L/T)
```

5.3 physical.Unit

The task of this class is keeping track of the unit term. The unit term is a fraction of units. The units in the enumerator and denominator can have an exponent.

Unit.new(u=nil)

Copy Constructor. It copies a given unit object. If nothing is given, an empty unit is created.

u: Unit

The unit object which will be copied.

return: Unit

The created Unit object

Unit.new(symbol, name, prefixsymbol=nil, prefixname=nil)

Constructor. A new Unit object with symbol is created. The prefixsymbol and prefixname are optional.

symbol: String

The symbol of the unit.

name: String

The name of the unit. prefixsymbol: String

The optional symbol of the prefix.

prefixname : String

The optional name of the prefix.

return : Unit

The created Unit object

Unit.tosiunitx(self)

The unit term will be compiled into a string, which the LaTeX package signity can understand.

return: String

The siunitx representation of the unit term.

5.4 physical.Number

It does arithmetics with gaussian error propagation. A number instance has a mean value called \mathbf{x} and an uncertainty called \mathbf{dx} .

Number.new(n=nil)

This is the copy Constructor. It copies a given number object. If n is nil, an instance representing number zero with uncertainty zero is created.

n: Number

The number object to be copied.

return : Number

The created Number instance.

Number.new(x, dx)

This constructor, creates a new instance with mean value ${\tt x}$ and uncertainty ${\tt dx}.$

x: number

mean value

dx : number

uncertainty value

return: Number

The created Number instance.

Example

```
1 n = N(12,0.1)
2 print(n)
```

Number.new(str)

This constructor creates a new instance from a string. It can parse strings of the form 3.4, 3.4e-3, 5.4e-3 +/- 2.4e-6, 5.45(7)e-23.

Parameters / Return

```
str:string
```

The number as a string.

return : Number

The created Number object

Example

```
1    n_1 = N("12.3e-6")
2    print(n_1)
3
4    n_2 = N("12 +/- 0.1")
5    print(n_2)
6
7    n_3 = N("12.0(1)")
8    print(n_3)
```

Number.mean(n)

Returns the mean value

Parameters / Return

return: number
The mean value

Number.uncertainty(n)

Returns the uncertainty value

Parameters / Return

return : number

The uncertainty value

Number.abs(n)

Returns the absolute value of the number.

Parameters / Return

return: number

The absolute value

Number.sqrt(n)

Returns the square root of the number.

Parameters / Return

return: number
The square root
